

**Introducing the biodegradable grease product line from EERSTA Lubricants.**

**Plante™** biodegradable greases are formulated with an ability to biodegrade more effectively than traditionally formulated mineral oil-based greases. Our grease manufacturing processes align with sustainability goals, by reducing consumption of energy, consumables, and waste generation.

In line with our values to embrace sustainability, environmental needs are considered alongside social and economic priorities. In doing so, we continue to deliver the expectations set forth by our stakeholders and the global community.

With the benefit of reducing the impact of lubrication on the planet and contribute to a positive change, users will be glad to know that the complete line-up of biodegradable grease is very well-suited for key industries like Marine, Railway, Paper and Pulp, Construction and Mining, as well as Agriculture and Forestry.

Backed by EAL certifications, ocean going vessels requiring such eco-friendly labels will find just the right fit of product needed for vessel maintenance. Common loss-lubrication applications in Railway and Agri can also adopt Plante™ as a solution to protect the world we live in.

Contact an EERSTA Lubricants representative today and make a difference.
